Project Description

My project idea is a health tracking app or website that includes communities and activities within the platform. These features are tracked to help users maximize their attention to both physical and mental health, it works in a scoring system, where users would compete to have the best score over the month.

I will develop this as a website that contains multiple pages (or windows). The main page will be the home page, which displays a simple brief about all sections, articles, simple interactive games, and health habit tracking tools. All of these elements will focus on improving young people's physical and mental health, you can access all of these in the side menu also.

The second main page is the profile page. This page will display user statistics, showing how the user is doing over time. It will also provide personalized suggestions based on the data collected during the user's activity on the platform.

The third main page is the community page, where users can share experiences and learn from others about their mental and physical health. The community will be organized into groups with clear guidelines to ensure a safe and supportive environment for users to find people with similar interests.

These three pillars will be our main focus in the platform, to fulfil a simple but efficient solutions to the health problems the youth are facing in the current circumstances.

Additionally, there will be a side menu that provides access to several services offered by the platform:

- A contact directory for specialists in fields such as psychiatry, gynecology, and nutrition. This will help users easily find professionals relevant to their needs and age group.
- An articles section where users can read short, reviewed content related to health topics. The articles will be designed to be concise and easy to read, allowing users to quickly gain useful knowledge without losing interest.
- An AI-powered assistant that will be connected to an LLM, available to access either as a from the side page or the floating button. Users can interact with the chatbot to discuss their concerns, receive suggestions, get recommended articles, or be guided toward appropriate specialists for further support.
